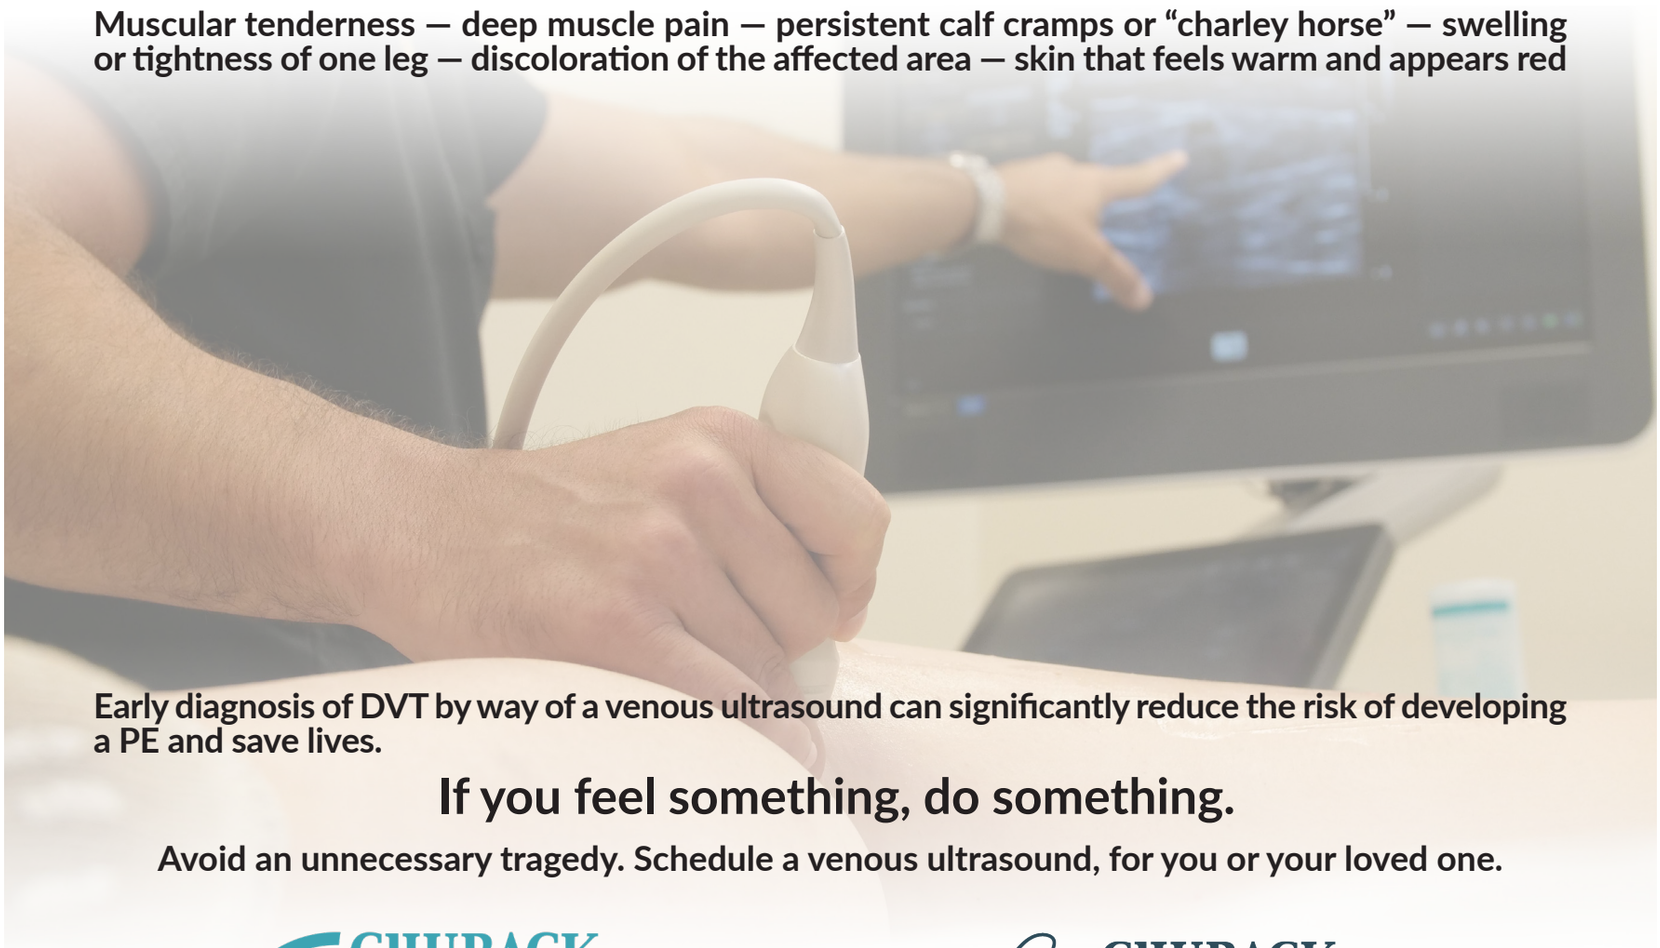
Awareness Saves Lives

March is DVT Awareness Month

Known as the "silent killer," Deep Vein Thrombosis, or DVT, is a medical condition that occurs when a blood clot forms in a deep vein. Blood clots can travel to the lungs and block pulmonary arteries, restricting blood flow and decreasing oxygen levels. This pulmonary embolus (PE) can be instantly fatal. Symptoms of DVT include:

Muscular tenderness — deep muscle pain — persistent calf cramps or "charley horse" — swelling or tightness of one leg — discoloration of the affected area — skin that feels warm and appears red



Early diagnosis of DVT by way of a venous ultrasound can significantly reduce the risk of developing a PE and save lives.

If you feel something, do something.

Avoid an unnecessary tragedy. Schedule a venous ultrasound, for you or your loved one.
